

CryptoSensei

AI character teaches crypto investing through short videos and on-chain trading simulations

The Problem & Our Solution

Investing education on social media is passive and boring, and beginners have no safe way to practice before risking real money.

- Short-video investing content is consumed passively, not actionable for beginners.
- Beginners fear real losses, so they avoid practicing until it's too late.
- CryptoSensei pairs AI-generated lesson videos with a risk-free trading simulator.
- Completing lessons and milestones mints shareable Solana NFT badges as proof of learning.

How It Works

Users watch AI character videos, practice trading with mock SOL/USDC, and earn on-chain proof of progress.

- User watches a short AI-generated lesson video on Instagram or TikTok.
- User plays an on-chain simulation using real-time Pyth price feeds with mock balances.
- Completing a lesson or milestone mints an NFT badge via Metaplex on Solana.
- Leaderboard ranks simulated portfolio returns among friends and followers.
- App auto-generates a shareable clip of the user's results for social media.

Built with

Solana, Solana Web3.js, Anchor, Metaplex NFT, Pyth price feeds, ElevenLabs/TTS API, Remotion or FFmpeg for video generation

Why Now & What's Next

Short-form video dominates attention, and Solana's low fees make frequent gamified minting practical.

- Short-form video is the primary content format for the 20-35 audience.
- Solana's low transaction fees make frequent NFT badge minting economically viable.
- Next: partner with crypto influencers to co-create AI character personas.
- Next: add real yield or reward pools for top simulated traders via sponsors.
- Next: expand badges into a composable on-chain reputation and credential layer.
